Python Programming Fundamentals Cheat Sheet

Package/Method	Description	Syntax and Code Example
		Syntax:
	Returns `True` if both statement1 and statement2 are `True`. Otherwise, returns `False`.	1. 1
AND		1. statement1 and statement2
		Copied!
		Example:
		1. 1 2. 2 3. 3 4. 4 5. 5 6. 6 7. 7 8. 8 9. 9 1. marks = 90
		 attendance_percentage = 87 if marks >= 80 and attendance_percentage >= 85: print("qualify for honors") else:
		 print("Not qualified for honors") 9. # Output = qualify for honors
		Copied!
		Syntax:
Class Definition	Defines a blueprint for creating objects and defining their attributes and behaviors.	1. 1
		1. class ClassName: # Class attributes and methods
		Copied!
		Example:
		1. 1 2. 2
		3. 3 4. 4
		 class Person: definit(self, name, age): self.name = name self.age = age
Define Function	A `function` is a reusable block of code that performs a specific task or set of tasks when called.	Copied!
		Syntax:
		1. 1
		<pre>1. def function_name(parameters): # Function body Copied!</pre>
		Example:
		 1. def greet(name): print("Hello,", name)
		Copied!
		Syntax:
Equal(==)	Checks if two values are equal.	1. 1
		1. variable1 == variable2
		Copied!
		Example 1:
		1. 1 1. 5 == 5
		Copied!
		returns True
		Example 2:
		1. 1
		1. age = 25 age == 30 Copied!
		Copidu

returns False

```
1. 1
                                                                                                     1. for variable in sequence: # Code to repeat
                                                                                                  Copied!
                                                                                                  Example 1:
                                                                                                     1. 1
2. 2
                         A 'for' loop repeatedly executes a block of code for a specified

    for num in range(1, 10):
    print(num)

For Loop
                         number of iterations or over a sequence of elements (list, range,
                         string, etc.).
                                                                                                  Copied!
                                                                                                  Example 2:
                                                                                                     1. 1
                                                                                                     2. 2
3. 3
                                                                                                     1. fruits = ["apple", "banana", "orange", "grape", "kiwi"]    2. for fruit in fruits:
                                                                                                            print(fruit)
                                                                                                  Copied!
                                                                                                  Syntax:
                                                                                                     1. 1

    function_name(arguments)

                         A function call is the act of executing the code within the function
Function Call
                         using the provided arguments.
                                                                                                  Example:
                                                                                                     1. 1

    greet("Alice")

                                                                                                  Copied!
                                                                                                  Syntax:
                                                                                                     1. 1
                                                                                                     1. variable1 >= variable2
                                                                                                  Copied!
                                                                                                  Example 1:
                                                                                                     1. 1
                                                                                                     1. 5 >= 5 and 9 >= 5
                                                                                                  Copied!
Greater Than or Equal Checks if the value of variable1 is greater than or equal to
To(>=)
                         variable2.
                                                                                                  returns True
                                                                                                  Example 2:
                                                                                                     1. 1
2. 2
                                                                                                     3. 3

    quantity = 105
    minimum = 100
    quantity >= minimum

                                                                                                  Copied!
                                                                                                  returns True
Greater Than(>)
                         Checks if the value of variable1 is greater than variable2.
                                                                                                  Syntax:
                                                                                                     1. variable1 > variable2
                                                                                                  Copied!
                                                                                                  Example 1: 9 > 6
                                                                                                  returns True
                                                                                                  Example 2:
                                                                                                     1. 1
2. 2
3. 3
                                                                                                     1. age = 20
2. max_age = 25
3. age > max_age
                                                                                                  Copied!
```

Syntax:

```
1. 1
                                                                                                              1. if condition: #code block for if statement
                                                                                                           Copied!
If Statement
                           Executes code block 'if' the condition is 'True'.
                                                                                                           Example:
                                                                                                              1. 1
2. 2

    if temperature > 30:
    print("It's a hot day!")

                                                                                                           Copied!
                                                                                                           Syntax:
                                                                                                              1. 1
                                                                                                              2. 2
3. 3
4. 4
                                                                                                              5. 5
6. 6
7. 7
                                                                                                              8.8

    if condition1:
    # Code if condition1 is True

    elif condition2:
    # Code if condition2 is True

    else:
    # Code if no condition is True

                                                                                                           Copied!
                           Executes the first code block if condition1 is 'True', otherwise
If-Elif-Else
                           checks condition2, and so on. If no condition is 'True', the else
                                                                                                           Example:
                           block is executed.
                                                                                                              1. 1

```

7. file.close()

Copied!

Syntax:

1. 1

1. while condition: # Code to repeat

Copied!

A `while` loop repeatedly executes a block of code as long as a specified condition remains `True`.

Example:

1. 1 2. 2

count = 0 while count < 5:
 print(count) count += 1

Copied!
