## Working with Data in Python Cheat Sheet

Opens a file Syntax:

using a with

with open()

## Reading and writing files

```
Package/Method Description
                                Syntax: r (reading) w (writing) a (appending) + (updating: read/write) b (binary, otherwise text)
                  Different
                  modes to
File opening
                  open files
modes
                                   1. Examples: with open("data.txt", "r") as file: content = file.read() print(content) with open("output.txt", "w") as
                  for specific
                  operations.
                                Copied!
                                Syntax:
                                   1. 1
                                  2. 2
3. 3
                                   1. file.readlines() # reads all lines as a list
                                   readline() # reads the next line as a string
                                   3. file.read() # reads the entire file content as a string
                  Different
                                Copied!
                  methods to
File reading
                  read file
                                Example:
methods
                  content in
                  various
                                  1. 1
2. 2
                  ways.
                                  3. 3
4. 4

    with open("data.txt", "r") as file:
    lines = file.readlines()

                                          next_line = file.readline()
content = file.read()
                                   3.
                                  4.
                                Copied!
                                Syntax:
                                  1. 1
2. 2

    file.write(content) # writes a string to the file

                                   2. file.writelines(lines) # writes a list of strings to the file
                  Different
                                Copied!
                  write
File writing
                  methods to
                                Example:
methods
                  write
                  content to a
                                   1. 1
                  file.
                                   3. 3
                                   1. lines = ["Hello\n", "World\n"]
2. with open("output.txt", "w") as file:
3. file.writelines(lines)
                                Copied!
                                Syntax:
                                   1. for line in file: # Code to process each line
                  Iterates
                                Copied!
                  through
Iterating over
                  each line in
                               Example:
                  the file
lines
                  using a
                                  1. 1
2. 2
                   'loop'.
                                   1. with open("data.txt", "r") as file:
                                   2. for line in file: print(line)
                                Copied!
                                Syntax:
                                   1. 1
                                  2. 2
                                   1. file = open(filename, mode) # Code that uses the file
                  Opens a
                                   2. file.close()
                  file,
                  performs
                                Copied!
                  operations,
Open() and
                  and
                                Example:
                  explicitly
close()
                  closes the
                                   1. 1
                  file using
                                  2. 2
3. 3
                  the close()
                  method.
                                   1. file = open("data.txt", "r")
                                   2. content = file.read()
                                   3. file.close()
                                Copied!
```

```
file closure
                                Copied!
                   after usage.
                                 Example:
                                    1. 1
                                    2. 2

    with open("data.txt", "r") as file:
    content = file.read()

Pandas
Package/Method
                                       Description
                                                                                                            Syntax and Code Example
                   Reads data from a '.CSV' file and creates a
                                                                         Syntax: dataframe_name = pd.read_csv("filename.csv") Example: df =
.read_csv()
                   DataFrame.
                                                                         pd.read_csv("data.csv")
                                                                         Syntax:
                                                                            1. 1
                                                                            1. dataframe_name = pd.read_excel("filename.xlsx")
                                                                          Copied!
                   Reads data from an Excel file and creates a
.read_excel()
                   DataFrame.
                                                                         Example:
                                                                            1. 1
                                                                            1. df = pd.read_excel("data.xlsx")
                                                                         Copied!
                                                                         Syntax:
                                                                            1. 1
                                                                            1. dataframe_name.to_csv("output.csv", index=False)
                                                                         Copied!
.to_csv()
                   Writes DataFrame to a CSV file.
                                                                         Example:
                                                                            1. 1
                                                                            1. df.to_csv("output.csv", index=False)
                                                                          Copied!
                                                                         Syntax:
                                                                            1. dataframe_name["column_name"] # Accesses single column
2. dataframe_name[["column1", "column2"]] # Accesses multiple columns
                                                                         Copied!
Access Columns DataFrame.
                   Accesses a specific column using [] in the
                                                                         Example:
                                                                            1. df["age"]
2. df[["name", "age"]]
                                                                         Copied!
                                                                         Syntax:

    dataframe_name.describe()

                                                                          Copied!
                   Generates statistics summary of numeric columns
describe()
                   in the DataFrame.
                                                                         Example:
                                                                            1. 1
                                                                            1. df.describe()
                                                                          Copied!
                   Removes specified rows or columns from the
drop()
                                                                         Syntax:
                   DataFrame. axis=1 indicates columns. axis=0
                                                                            1. 1
2. 2
                   indicates rows.
                                                                            1. dataframe_name.drop(["column1", "column2"], axis=1, inplace=True)
2. dataframe_name.drop(index=[row1, row2], axis=0, inplace=True)
                                                                         Copied!
                                                                         Example:
```

1. with open(filename, mode) as file: # Code that uses the file

block,

ensuring

automatic

1. 1

```
1. df.drop(["age", "salary"], axis=1, inplace=True) # Will drop columns
2. df.drop(index=[5, 10], axis=0, inplace=True) # Will drop rows
                                                                         Copied!
                                                                        Syntax:
                                                                           1. 1

    dataframe_name.dropna(axis=0, inplace=True)

                                                                         Copied!
                   Removes rows with missing NaN values from the
dropna()
                   DataFrame. axis=0 indicates rows.
                                                                         Example:
                                                                           1. 1

    df.dropna(axis=0, inplace=True)

                                                                         Copied!
                                                                        Syntax:
                                                                           1. 1

    dataframe_name.duplicated()

                                                                         Copied!
                   Duplicate or repetitive values or records within a
duplicated()
                   data set.
                                                                        Example:
                                                                           1. 1
                                                                           1. duplicate_rows = df[df.duplicated()]
                                                                         Copied!
                                                                         Syntax:
                                                                           1. 1
                                                                           1. filtered_df = dataframe_name[(Conditional_statements)]
                                                                         Copied!
                   Creates a new DataFrame with rows that meet
Filter Rows
                   specified conditions.
                                                                         Example:
                                                                           1. 1
                                                                           1. filtered_df = df[(df["age"] > 30) & (df["salary"] < 50000)
                                                                         Copied!
                                                                        Syntax:

    grouped = dataframe_name.groupby(by, axis=0, level=None, as_index=True,
    sort=True, group_keys=True, squeeze=False, observed=False, dropna=True)

                   Splits a DataFrame into groups based on specified
                                                                         Copied!
groupby()
                   criteria, enabling subsequent aggregation,
                   transformation, or analysis within each group.
                                                                         Example:
                                                                           1. 1
                                                                           1. grouped = df.groupby(["category", "region"]).agg({"sales": "sum"})
                                                                         Copied!
                                                                        Syntax:
                                                                           1. 1

    dataframe_name.head(n)

                                                                         Copied!
head()
                   Displays the first n rows of the DataFrame.
                                                                         Example:
                                                                           1. 1
                                                                           1. df.head(5)
                                                                         Copied!
                                                                        Syntax:
                                                                           1. 1
                                                                           1. import pandas as pd
                                                                         Copied!
                   Imports the Pandas library with the alias pd.
Import pandas
                                                                         Example:
                                                                           1. 1
                                                                           1. import pandas as pd
                                                                         Copied!
```

```
1. 1

    dataframe name.info()

                                                                 Copied!
                 Provides information about the DataFrame,
info()
                 including data types and memory usage.
                                                                 Example:
                                                                   1. 1
                                                                   1. df.info()
                                                                  Copied!
                                                                 Syntax:
                                                                   1. 1
                                                                   1. merged_df = pd.merge(df1, df2, on=["column1", "column2"])
                                                                 Copied!
                 Merges two DataFrames based on multiple
merge()
                 common columns.
                                                                 Example:
                                                                   1. 1
                                                                   1. merged_df = pd.merge(sales, products, on=["product_id", "category_id"])
                                                                 Copied!
                                                                 Syntax:
                                                                   1. 1

    print(df) # or just type df

                                                                 Copied!
print DataFrame Displays the content of the DataFrame.
                                                                 Example:

    print(df)
    df

                                                                 Copied!
                                                                 Syntax:
                                                                   1. 1

    dataframe_name["column_name"].replace(old_value, new_value, inplace=True)

                                                                 Copied!
                 Replaces specific values in a column with new
replace()
                                                                 Example:
                                                                   1. 1
                                                                   1. df["status"].replace("In Progress", "Active", inplace=True)
                                                                 Copied!
                                                                 Syntax:
                                                                   1. 1

    dataframe_name.tail(n)

                                                                 Copied!
tail()
                 Displays the last n rows of the DataFrame.
                                                                 Example:
                                                                   1. 1
                                                                   1. df.tail(5)
                                                                 Copied!
Numpy
   Package/Method
                                    Description
                                                                                     Syntax and Code Example
                                                              Syntax:
                                                                1. 1
                                                                1. import numpy as np
                                                              Copied!
Importing NumPy
                       Imports the NumPy library.
                                                              Example:
                                                                1. 1
                                                                1. import numpy as np
                                                              Copied!
np.array()
                       Creates a one or multi-dimensional array, Syntax:
```

1. 1

Syntax:

```
2. 2
1. array_1d = np.array([list1 values]) # 1D Array
2. array_2d = np.array([list1 values]), [list2 values]]) # 2D Array

Copied!

Example:

1. 1
2. 2
1. array_1d = np.array([1, 2, 3]) # 1D Array
2. array_2d = np.array([1, 2, 3]) # 1D Array
2. array_2d = np.array([1, 2], [3, 4]]) # 2D Array

Copied!

Example:

1. 1
2. 2
3. 3
4. 4
5. 5
5
1. np.mean(array)
2. np.sum(array)
3. np.min(array)
4. np.max(array)
5. np.dot(array_1, array_2)

Copied!
```
