Cheat Sheet: API's and Data Collection

```
Package/Method
                                             Description
                                                                                                                                                                  Code Example
                                                                                     1. 1
                                                                                     1. attribute = element[(attribute)]
                                                                                   Copied!
Accessing element Access the value of a specific attribute of an HTML attribute element.
                                                                                   Example:
                                                                                     1. 1
                                                                                     1. href = link_element[(href)]
                                                                                   Copied!
                                                                                   Syntax:
                                                                                     1. 1

    soup = BeautifulSoup(html, (html.parser))

                     Parse the HTML content of a web page using BeautifulSoup. The parser type can vary based on the project.
                                                                                   Copied!
BeautifulSoup()
                                                                                   Example:
                                                                                     1. 1
                                                                                     1. html = (https://api.example.com/data) soup = BeautifulSoup(html, (html.parser))
                                                                                   Copied!
                                                                                   Syntax:
                                                                                     1. 1
                                                                                     1. response = requests.delete(url)
                     delete()
                                                                                      1. 1
                                                                                     1. response = requests.delete((https://api.example.com/delete))
                                                                                   Copied!
                                                                                   Syntax:
                                                                                     1. 1
                                                                                     1. element = soup.find(tag, attrs)
                     Find the first HTML element that matches the specified tag and attributes.
find()
                                                                                   Example:
                                                                                     1. 1
                                                                                     1. first_link = soup.find((a), {(class): (link)})
                                                                                   Copied!
                                                                                   Syntax:
                                                                                     1. 1
                                                                                     1. elements = soup.find_all(tag, attrs)
                                                                                   Copied!
                     Find all HTML elements that match the specified tag and
find_all()
                                                                                     1. 1
                                                                                      1. all_links = soup.find_all((a), {(class): (link)})
                                                                                   Copied!
                                                                                   Syntax:
                                                                                     1. 1
                                                                                     1. children = element.findChildren()
findChildren()
                     Find all child elements of an HTML element.
                                                                                   Example
                                                                                     1. 1
                                                                                     1. child_elements = parent_div.findChildren()
                                                                                   Copied!
                                                                                   Syntax:
                                                                                     1. 1
                                                                                     1. response = requests.get(url)
                     Perform a GET request to retrieve data from a specified
                     URL. GET requests are typically used for reading data from an API. The response variable will contain the server's Example: response, which you can process further.
get()
                                                                                     1. response = requests.get((https://api.example.com/data))
                                                                                   Copied!
                                                                                   Syntax:
                                                                                     1. 1
                                                                                     1. headers = {(HeaderName): (Value)}
                     Include custom headers in the request. Headers can provide Copied!
Headers
                     additional information to the server, such as authentication
                                                                                   Example:
                     tokens or content types
                                                                                     1. base_url = (https://api.example.com/data) headers = {(Authorization): (Bearer YOUR_TOKEN)} response = requests.get(base_url, headers=headers)
                                                                                   Copied!
                                                                                   Syntax:
                                                                                     1. 1
                    Import the necessary Python libraries for web scraping.
Import Libraries
                                                                                     1. from bs4 import BeautifulSoup
                                                                                   Copied!
                     Parse JSON data from the response. This extracts and works with the data returned by the API. The response, json() method converts the JSON response into a Python data structure (usually a dictionary or list).
                                                                                    1. 1
                                                                                     1. data = response.json()
                                                                                   Copied!
                                                                                   Example:
                                                                                      1. response = requests.get((https://api.example.com/data))
2. data = response.json()
```

```
Syntax:
                                                                                                                          1. 1
                                                                                                                           1. sibling = element.find_next_sibling()
                                                                                                                       Copied!
next_sibling()
                              Find the next sibling element in the DOM.
                                                                                                                       Example:
                                                                                                                           1. 1
                                                                                                                           1. next_sibling = current_element.find_next_sibling()
                                                                                                                       Copied!
                                                                                                                        Syntax:
                                                                                                                          1. 1
                                                                                                                           1. parent = element.parent
                              Access the parent element in the Document Object Model (DOM).
                                                                                                                       Copied!
parent
                                                                                                                       Example:
                                                                                                                           1. 1
                                                                                                                           1. parent_div = paragraph.parent
                                                                                                                       Copied!
                                                                                                                       Syntax:
                                                                                                                          1. 1
                                                                                                                           1. response = requests.post(url, data)
                              Send a POST request to a specified URL with data. Create or update POST requests using resources on the server. The data parameter contains the data to send to the server, often Example:
post()
                              in JSON format.
                                                                                                                           1. 1
                                                                                                                           1. response = requests.post((https://api.example.com/submit), data={(key): (value)})
                                                                                                                       Copied!
                                                                                                                       Svntax:
                                                                                                                           1. 1
                                                                                                                           1. response = requests.put(url, data)
                              Send a PUT request to update data on the server. PUT
                              requests are used to update an existing resource on the server with the data provided in the data parameter, typically in JSON format.
put()
                                                                                                                        Example
                                                                                                                           1. 1
                                                                                                                           1. response = requests.put((https://api.example.com/update), data={(key): (value)})
                                                                                                                       Copied!
                                                                                                                        Syntax:
                                                                                                                           1. 1
                                                                                                                           1. params = {(param_name): (value)}
                                                                                                                       Copied!
                              Pass query parameters in the URL to filter or customize the request. Query parameters specify conditions or limits for the requested data.

1. 1
                                                                                                                           1. 1
2. 2
3. 3
                                                                                                                           1. base_url = "https://api.example.com/data"
2. params = {"page": 1, "per_page": 10}
3. response = requests.get(base_url, params=params)
                                                                                                                       Copied!
                                                                                                                        Syntax:
                                                                                                                          1. 1

    element = soup.select(selector)

                                                                                                                       Copied!
                              Select HTML elements from the parsed HTML using a
select()
                                                                                                                       Example:
                                                                                                                           1. 1
                                                                                                                           1. titles = soup.select((h1))
                                                                                                                       Copied!
                                                                                                                        Syntax:
                                                                                                                          1. 1
                                                                                                                          1. response.status code
                                                                                                                       Copied!
                              Check the HTTP status code of the response. The HTTP status code indicates the result of the request (success, error, redirection). Use the HTTP status codelt can be used for error handling and decision-making in your code.
                                                                                                                       Example:
status code

    url = "https://api.example.com/data"
    response = requests.get(url)
    status_code = response.status_code

                                                                                                                        Copied!
                                                                                                                        Tag Example
                                                                                                                          1. 1
